

Imaging underground cavities by cosmic-ray muons: observations at Mt. Echia, Naples, Italy

Giulio Saracino

PHYSICS DEPARTMENT *ETTORE PANCINI*

and

INFN- Napoli

Summary

- METROPOLIS Project
- Mt. Echia site
- MU-RAY detector
- Data tacking
- Bulk density
- Cavities detection
- Conclusions

Technological district STRESS

Technological district (mixed partnership public and private)

Devoted to the sustainable buildings

company partner

member of STRESS

joint-stock company specialized on geological survey

METROPOLIS Project

Project devoted to the

INTEGRATED AND SUSTAINABLE
METHODS AND TECHNOLOGIES
FOR RESILIENCE AND SAFETY IN
URBAN SYSTEMS

Six work packages

- **URBAN SYSTEM KNOWLEDGE**
- DISRUPTION OF URBAN SYSTEM
- PHYSICAL SYSTEM VULNERABILITY
- INTEGRATED HAZARD OF URBAN SYSTEM
- SOCIAL AND ECONOMIC SYSTEM
VULNERABILITY
- STRATEGIES AND TECHNOLOGIES FOR
SUSTAINABLE URBAN SYSTEM

End of the project: December 2016

Funded by
Italian Ministry of Instruction,
University and Research

METROPOLIS PON 03PE_00093_4

URBAN SYSTEM KNOWLEDGE W.P.

Beside traditional survey methods an experimentation task on muography was inserted.

The focus is on underground cavity detection, in particular in urban context.

The project was articulated in three work packages:

- Feasibility Studies
- Cylindrical detector for bore hole
- An experiment to test the method

INFN was engaged to supervise this task.

Mt Echia as a laboratory

VIII B.C.

The ancient Greek village
"Parthenope"

Then Palepolis (Old City)

when the new city of Neapolis
was founded.

Mt Echia

bulk: yellow Neapolitan tuff

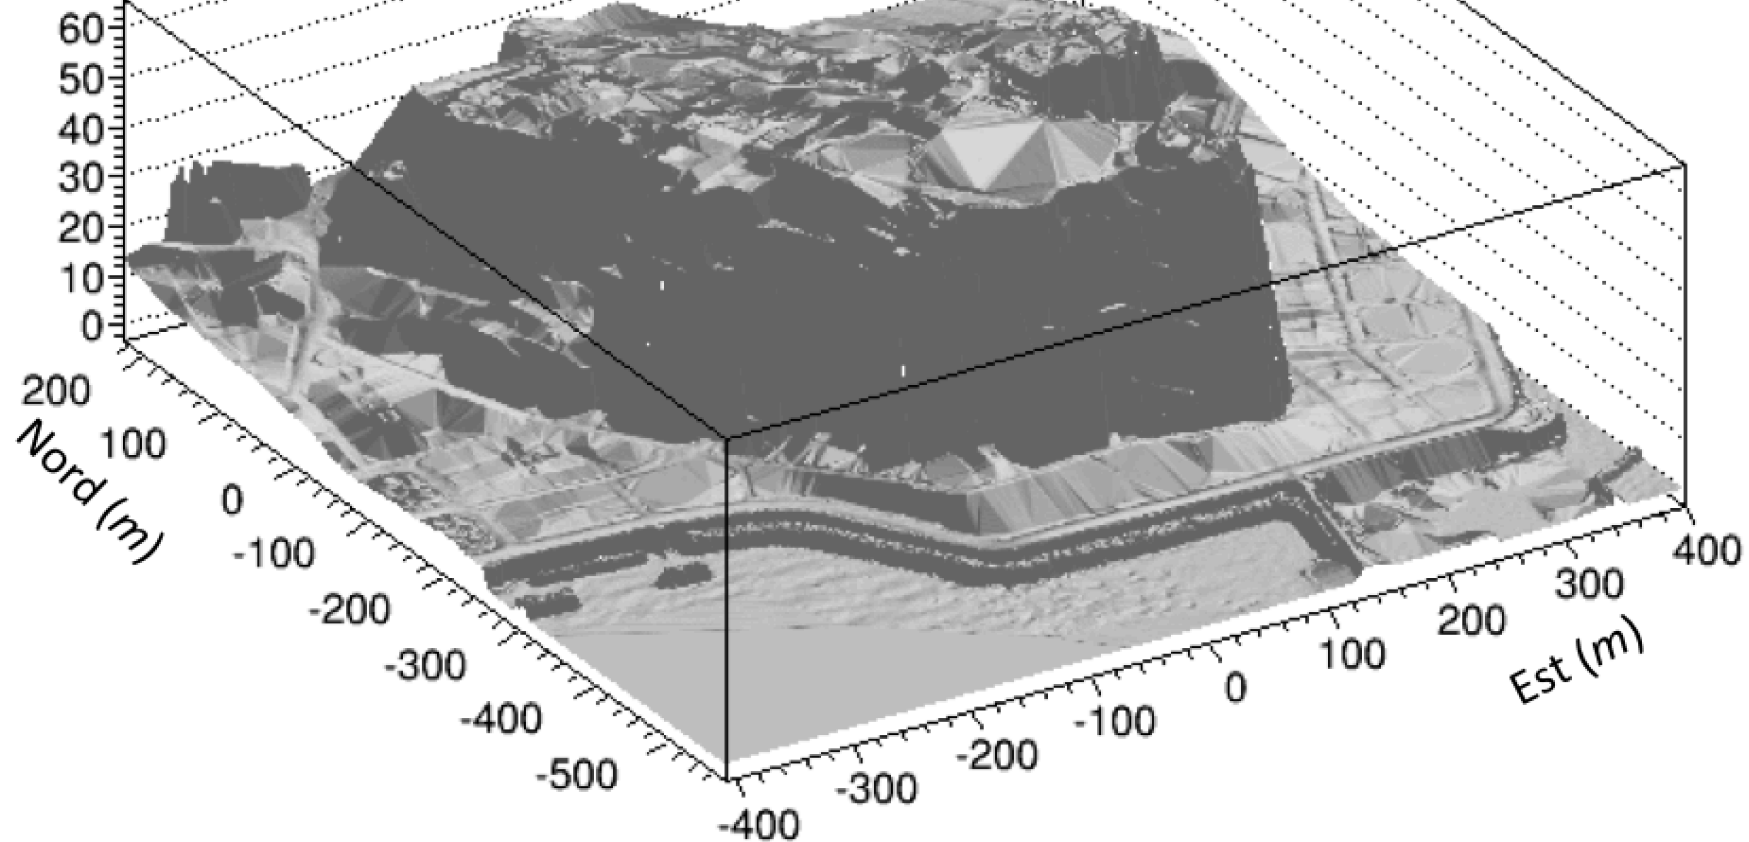

ρ 1.0 ÷ 1.2 g/cm³

max altitude: 60 m a.s.l.

Mt. Echia

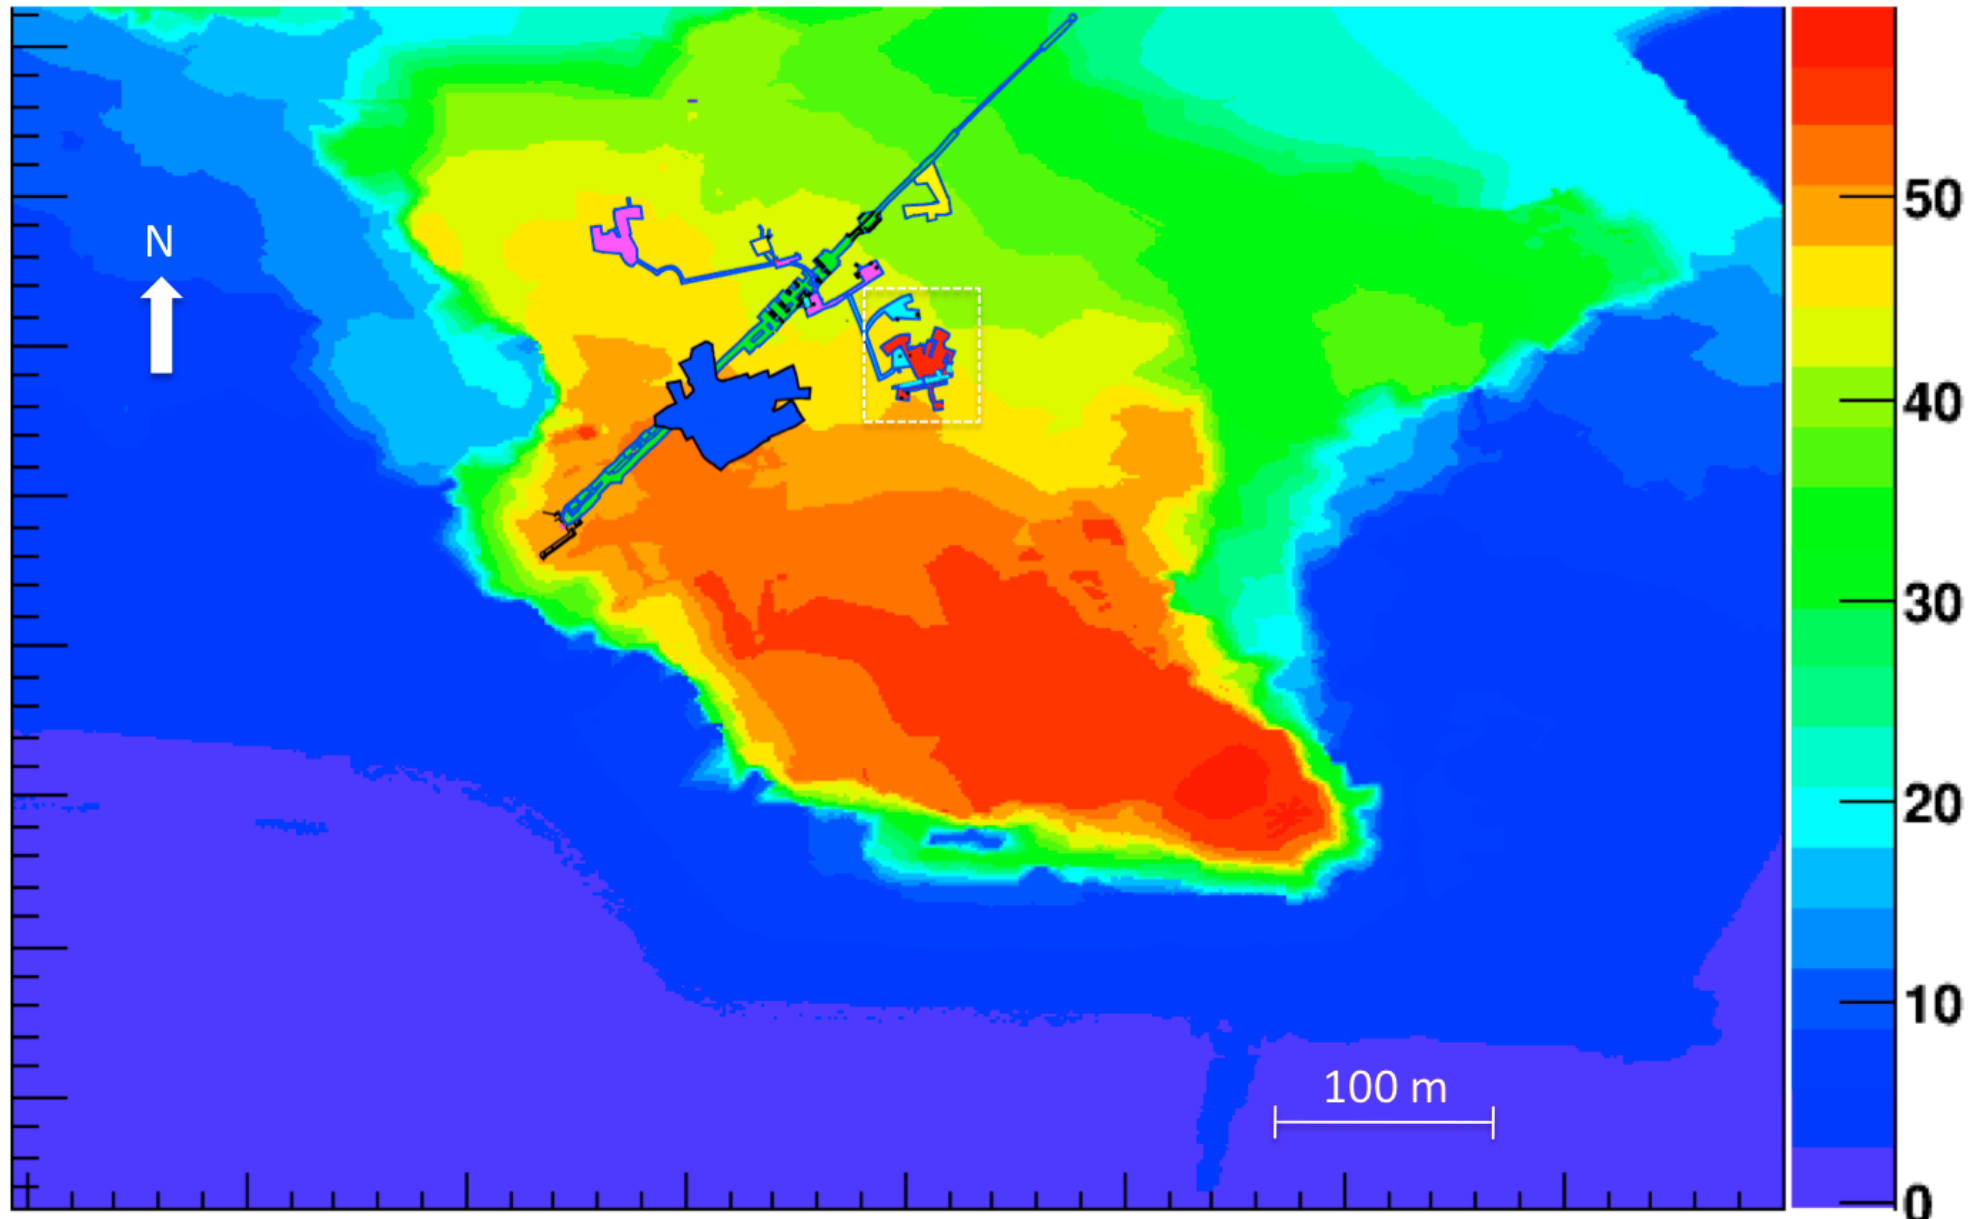

3D DTM

m a.s.l.

Mt Echia

Large number of natural as well as anthropic caverns

The Bourbonic Tunnel

1853 Ferdinand II of the Bourbon House - King of the Two Sicilies.

Restored in recent times and inserted in one of the archaeological underground itineraries.

Large number of underground structures have been rediscovered.

The exploration is continuing.

The Bourbonic Tunnel

The Bourbonic Tunnel

The site

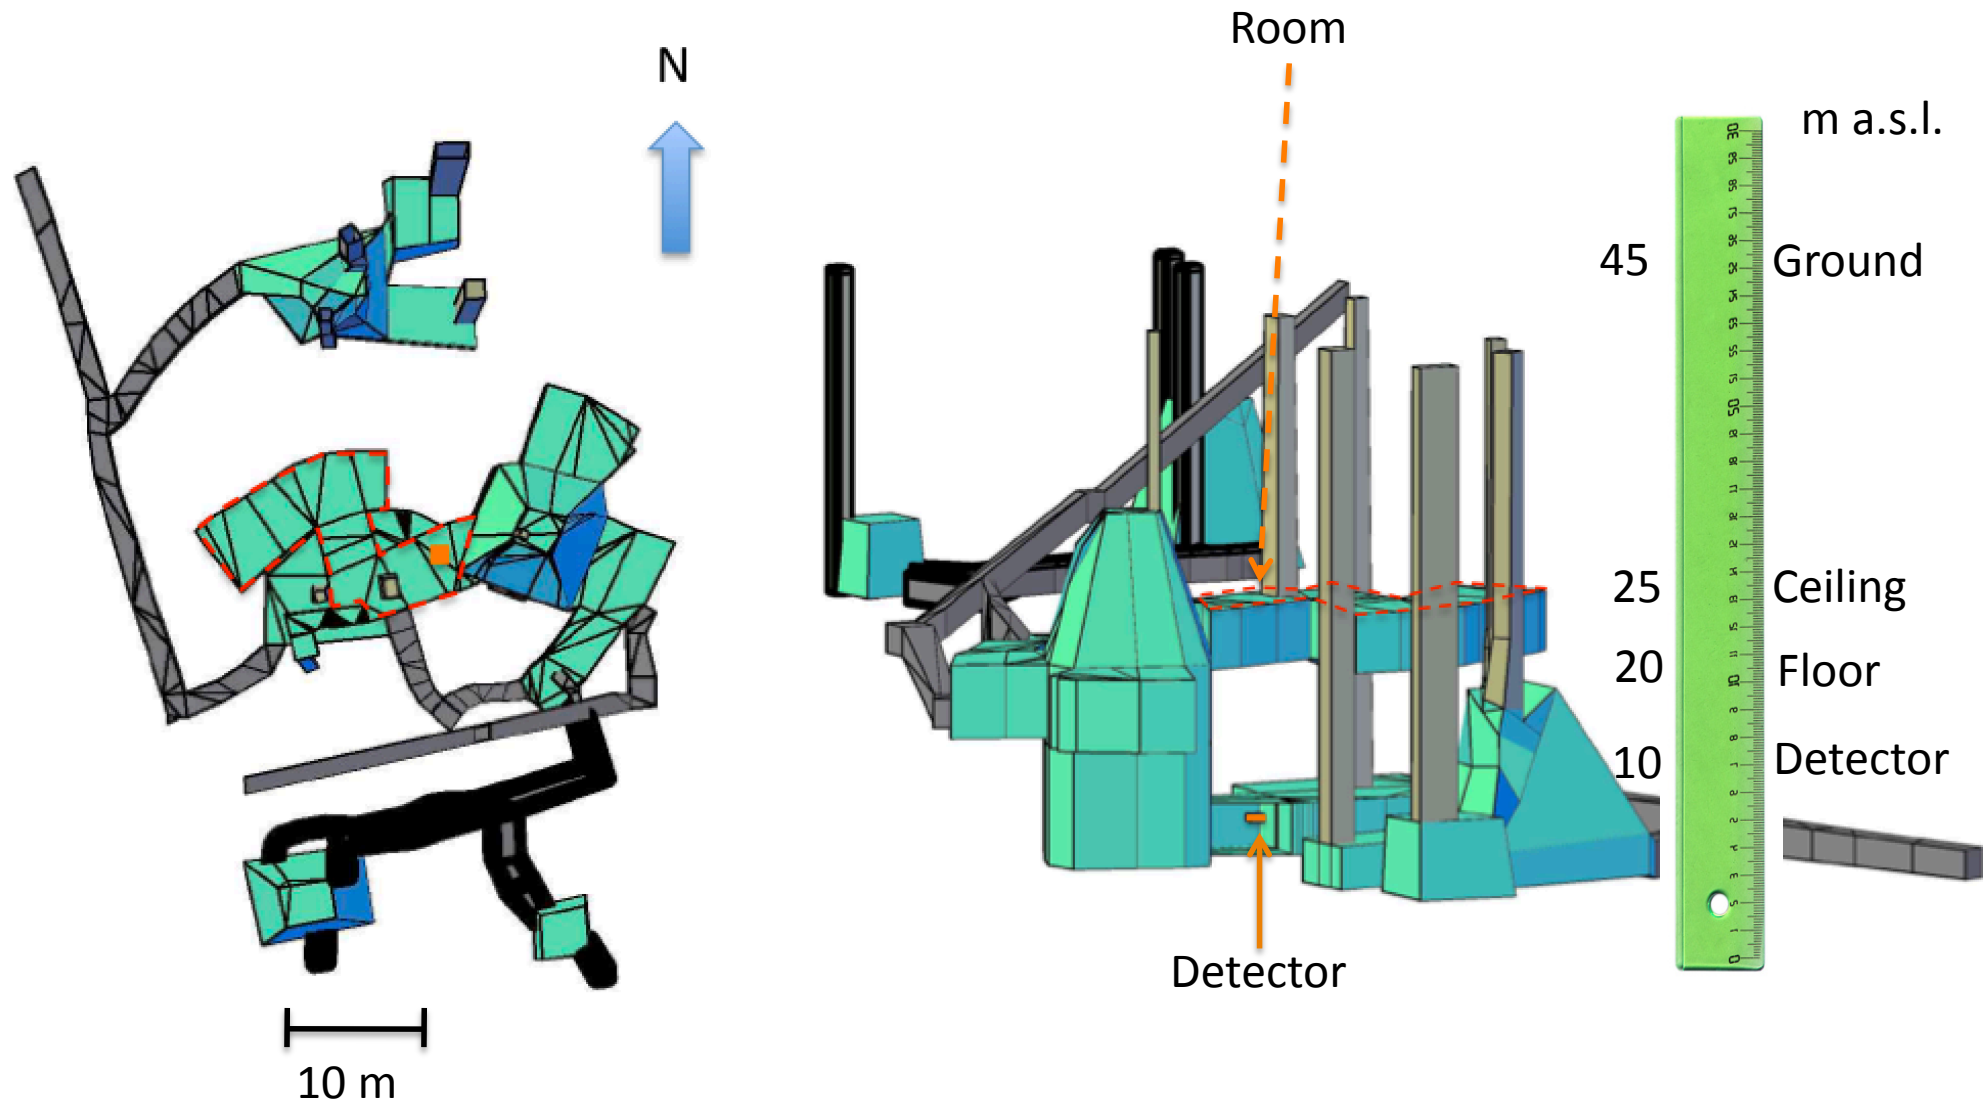

12 m a.s.l.

35 m to the ground

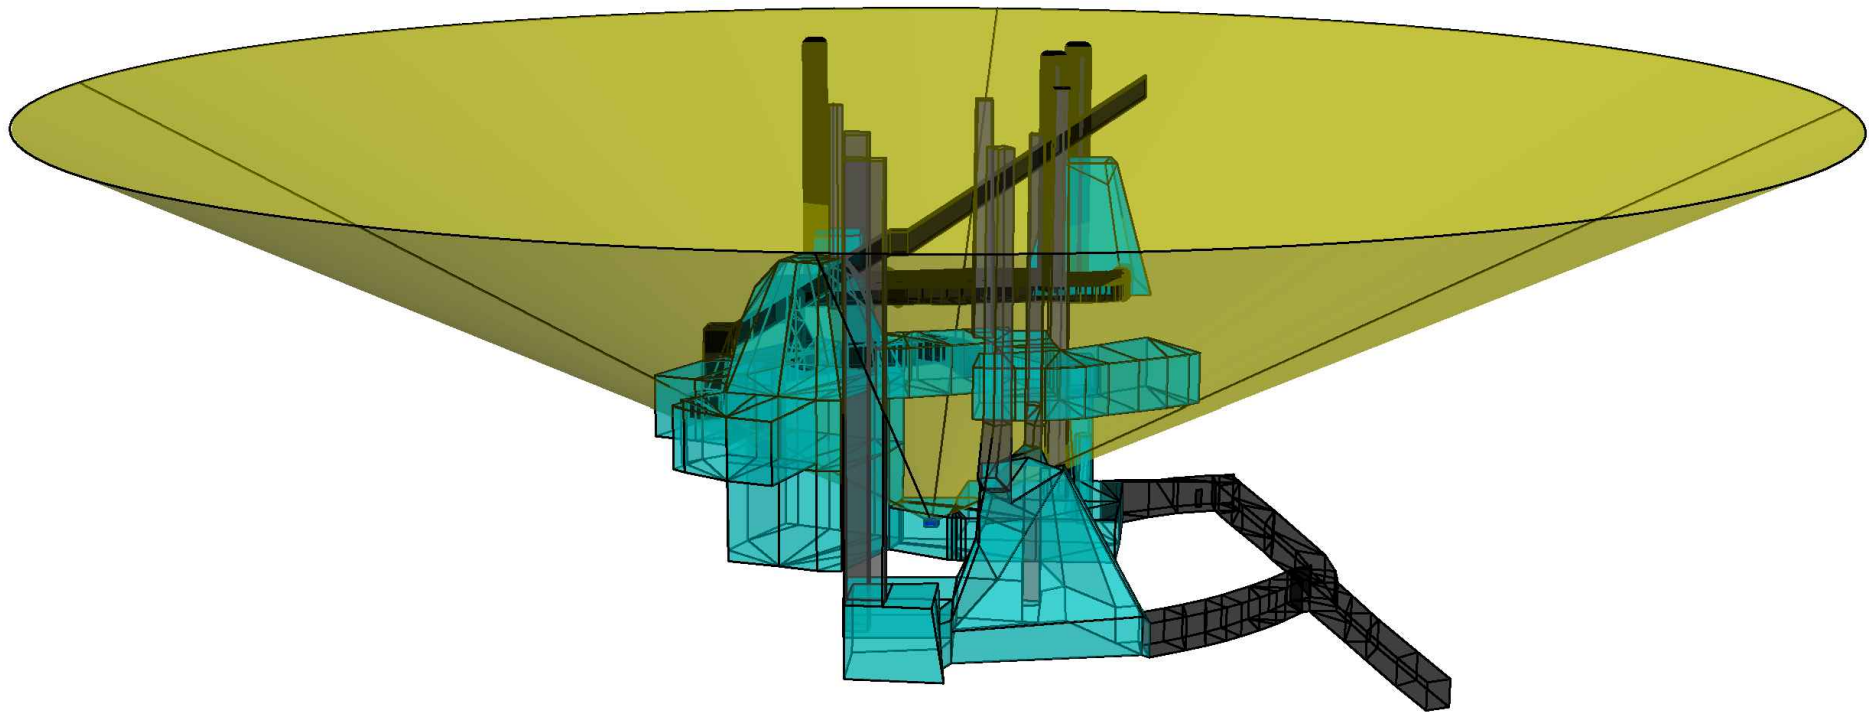

The test

find a room above the detector

Other known structures inside acceptance

Detector acceptance: 63° angle cone

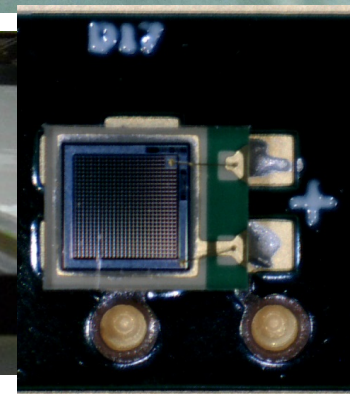

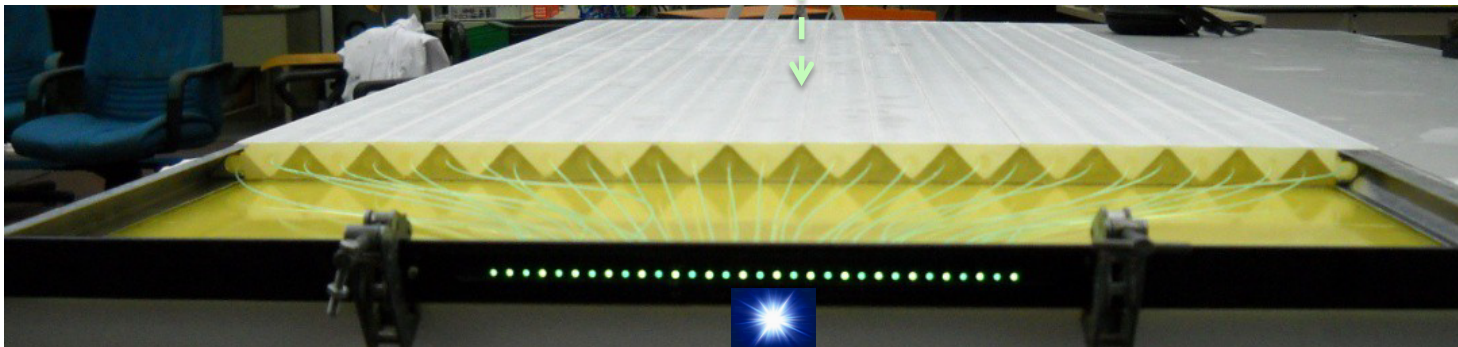

The detector

Murray up-graded detector prototype:
Plastic scintillators with triangular shape
WLS fibers
Silicon photomultiplier
Easiroc1B F.E.E. chip
Three X-Y planes 1 m² sensitive surf.

2 mm x and y resolution
4 mrad angular resolution (0.25° re-binned to 3°)

0.5 m distance between planes
63° zenith acceptance

Four detectors under construction for the MURAVES experiment at Vesuvius.

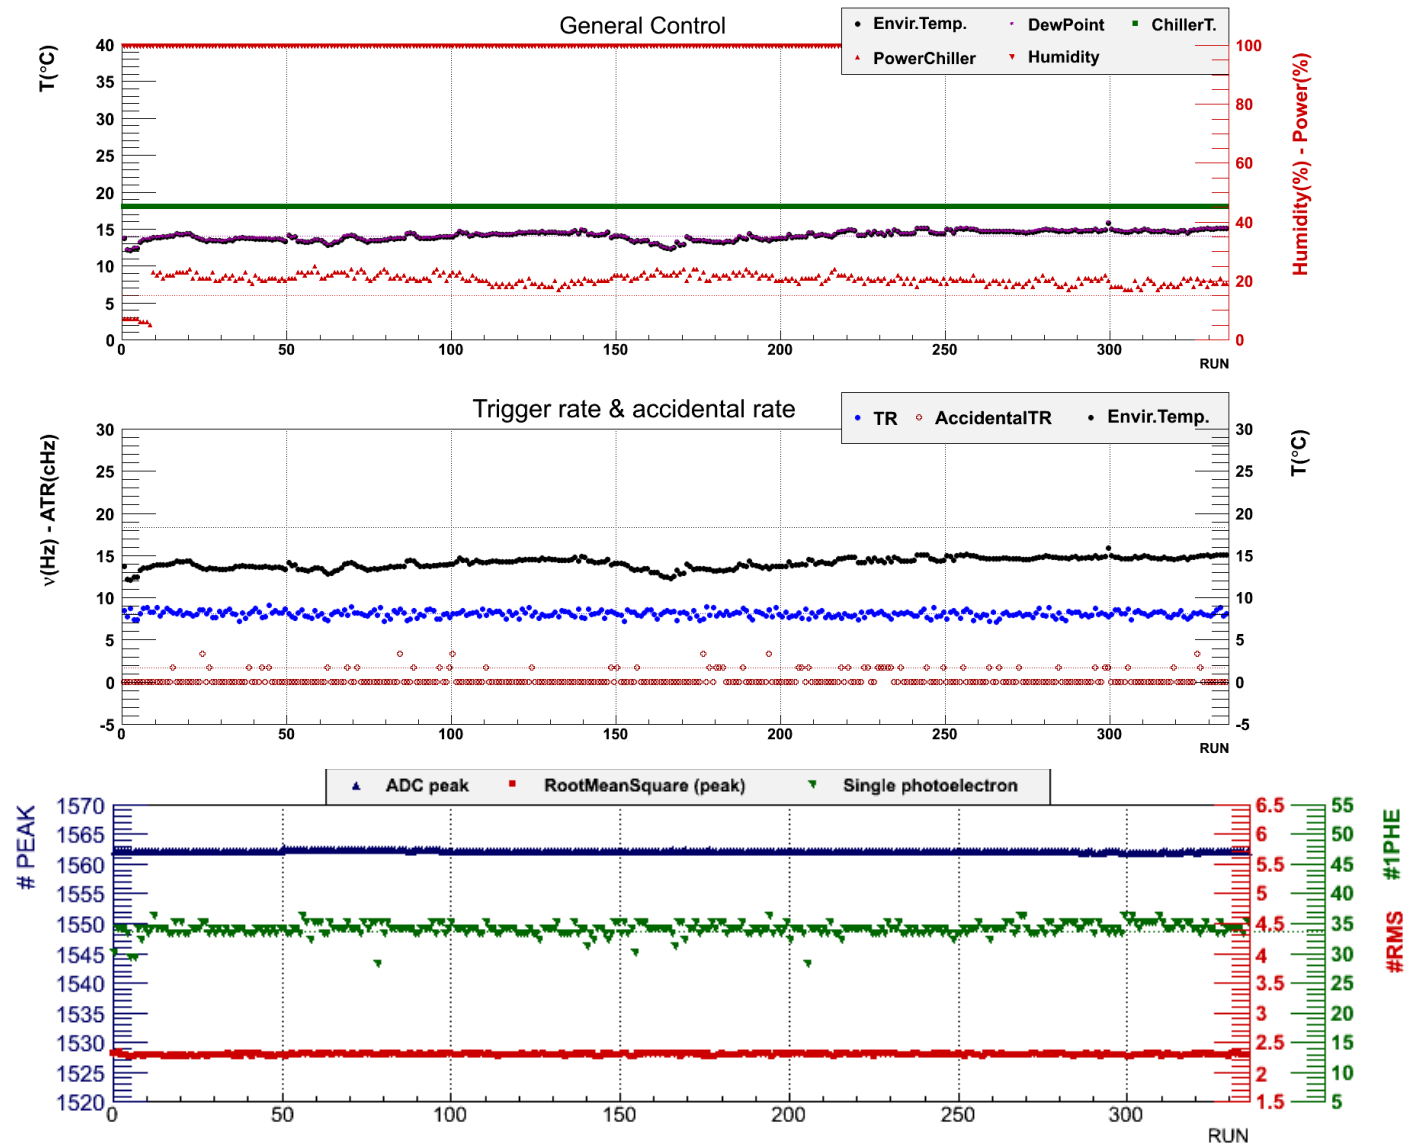

Data Taking

Gallery : 14×10^6 events in 26 days

Laboratory : 12×10^6 events of "free SKY"

Environment and detector Monitoring

Data analysis: relative transmission

We define

$$T^m(\alpha, \phi) = \frac{1}{C} \frac{N^u(\alpha, \phi)}{N^{fs}(\alpha, \phi)}$$

Measured transmission

corrected for the different time acquisition

$$T(\rho, \alpha, \phi) = \frac{\int_{E_{min}}^{\infty} \Phi(\alpha, \phi, E) dE}{\int_{E_0}^{\infty} \Phi(\alpha, \phi, E) dE}$$

Expected transmission

calculated in the NO cavities hypothesis

As first approximation $\rho = 1.2 \text{ g/cm}^3$ was used
(sample measurement)

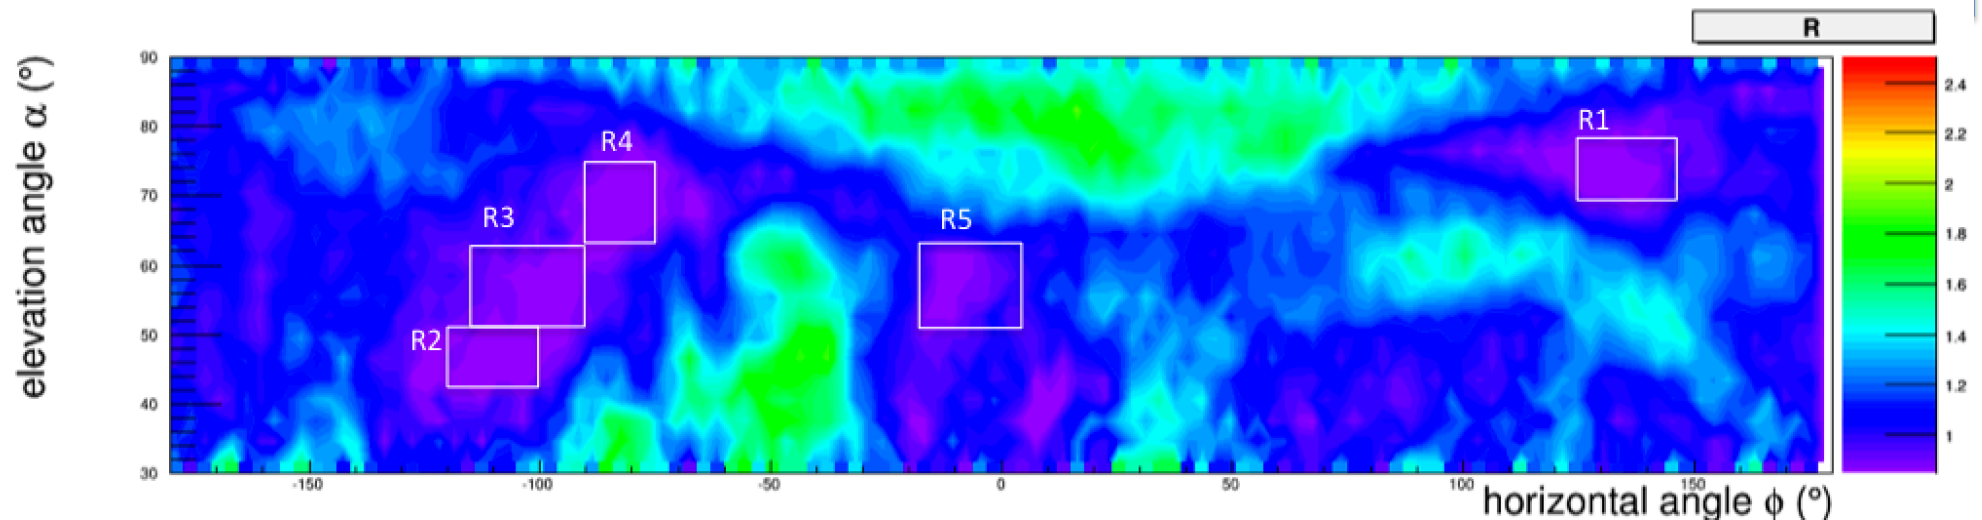

$$R(\rho, \alpha, \phi) = \frac{T^m(\alpha, \phi)}{T(\rho, \alpha, \phi)}$$

Relative transmission:

≈ 1 if no cavities are present and correct density

$R(\alpha, \phi) > 1 \rightarrow$ mean density lower than expected \rightarrow cavity

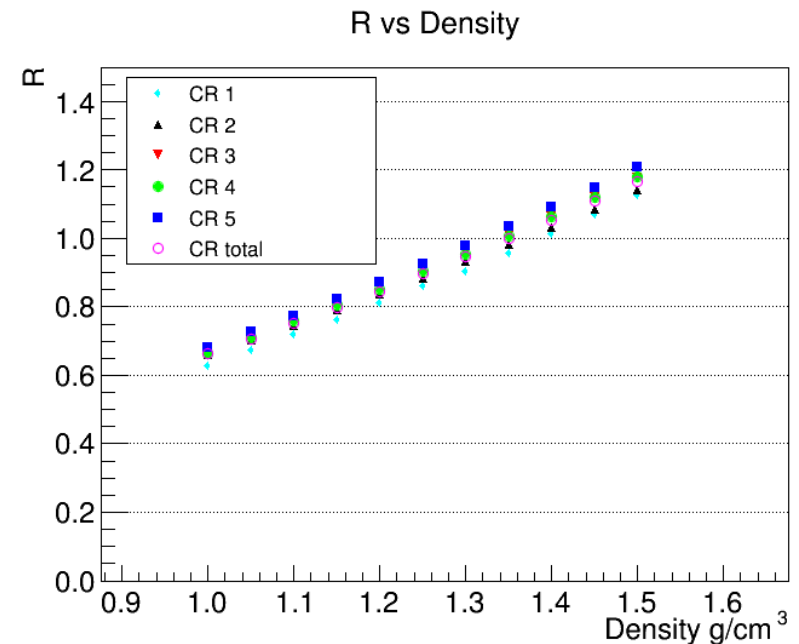

Relative transmission with $\rho = 1.2 \text{ g/cm}^3$

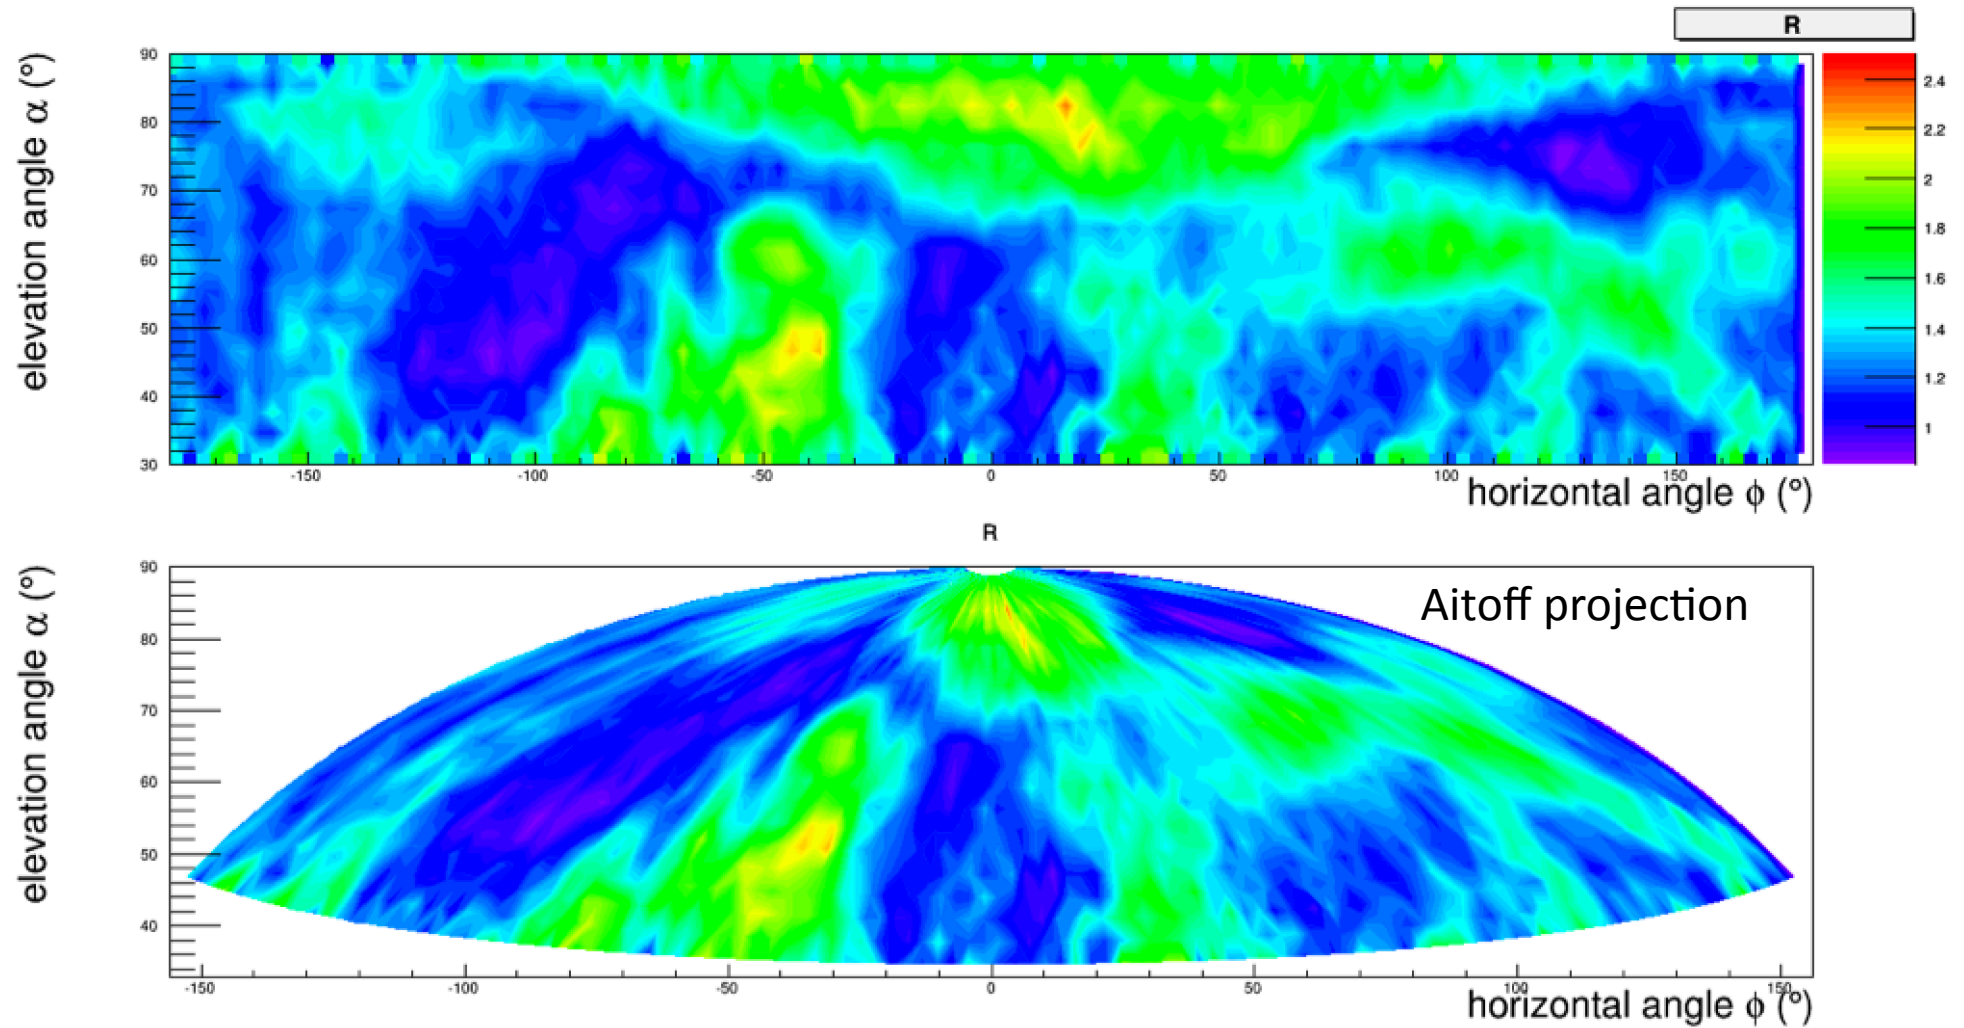

Clear evidence of structures with $R > 1$ (green)

To improve R we estimated the best density value using five control regions where R is at the minimum.

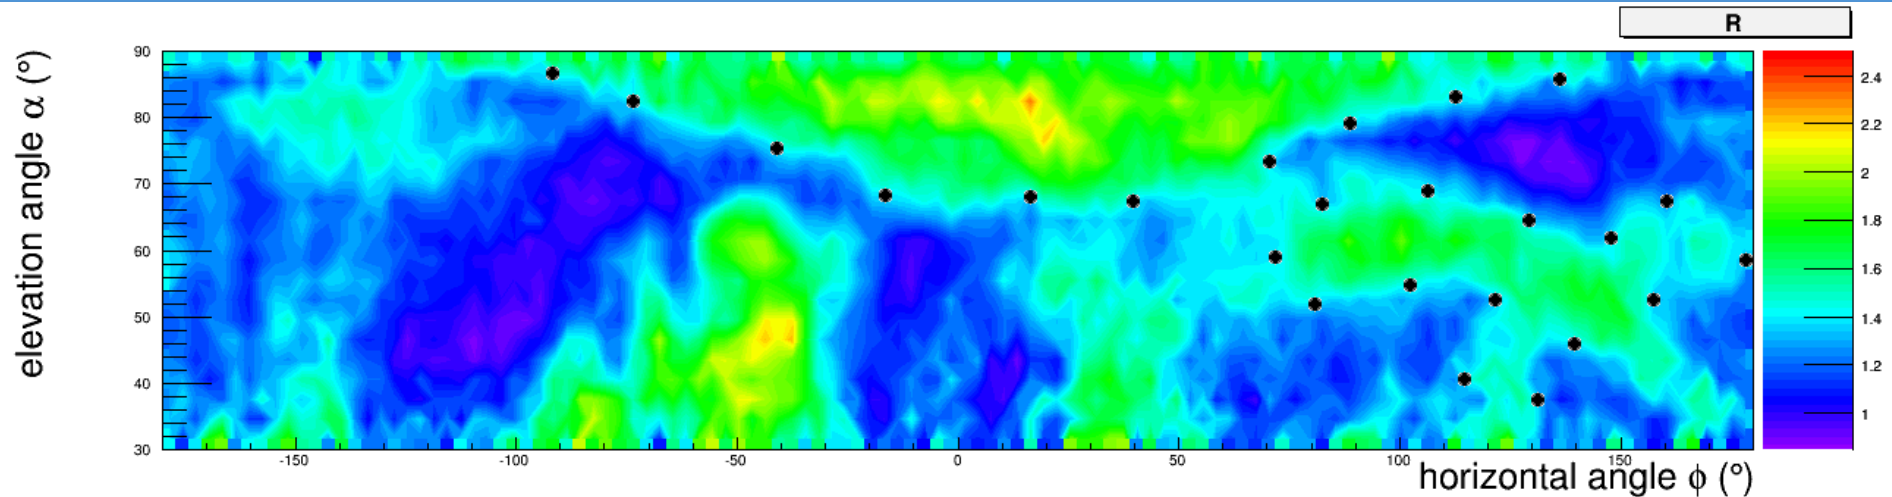

$\rho_{\text{bes}} = 1.35 \text{ g/cm}^3$ gives $R = 1$
in the control regions

Relative transmission with $\rho = 1.35 \text{ g/cm}^3$

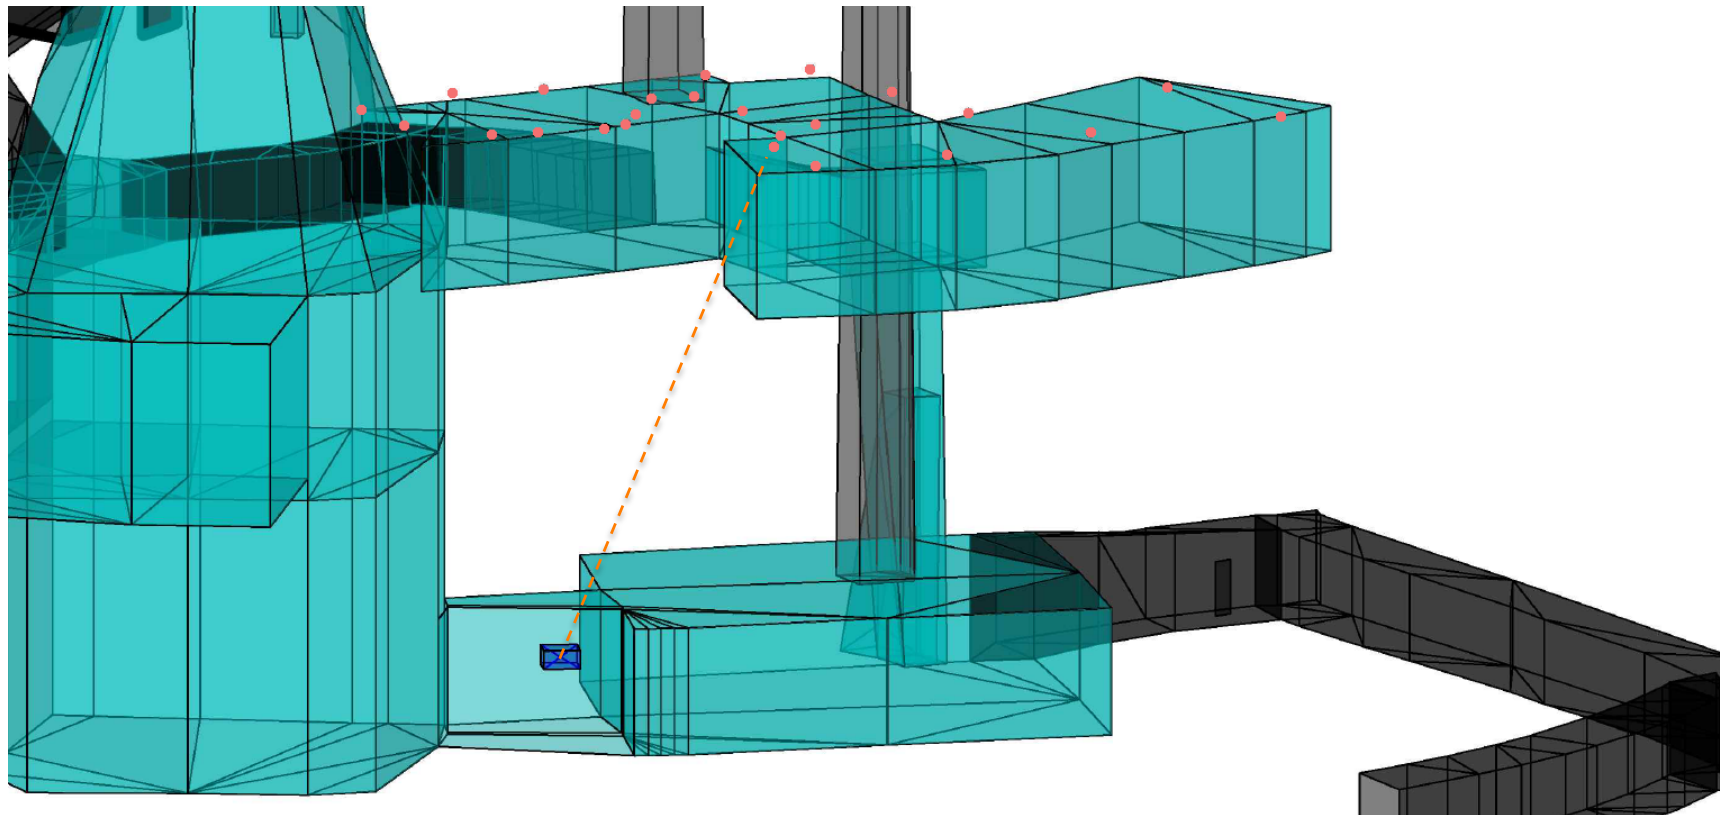

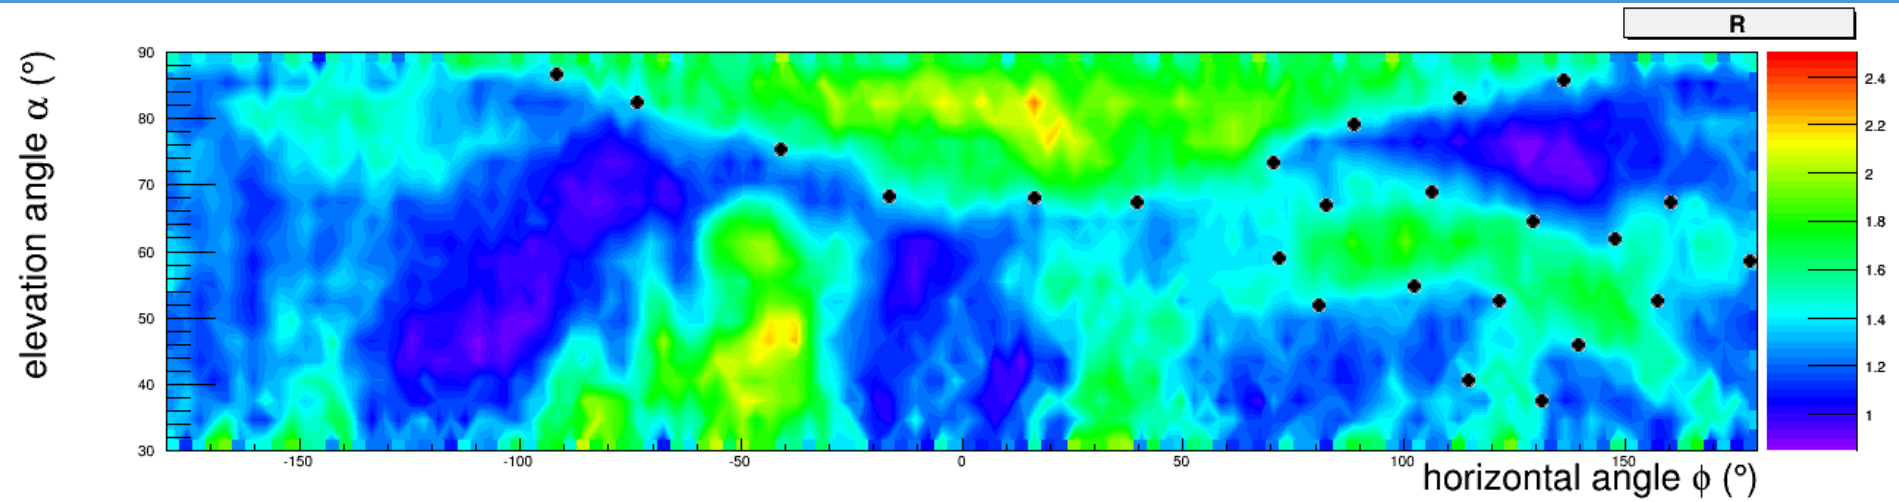

The room above the detector

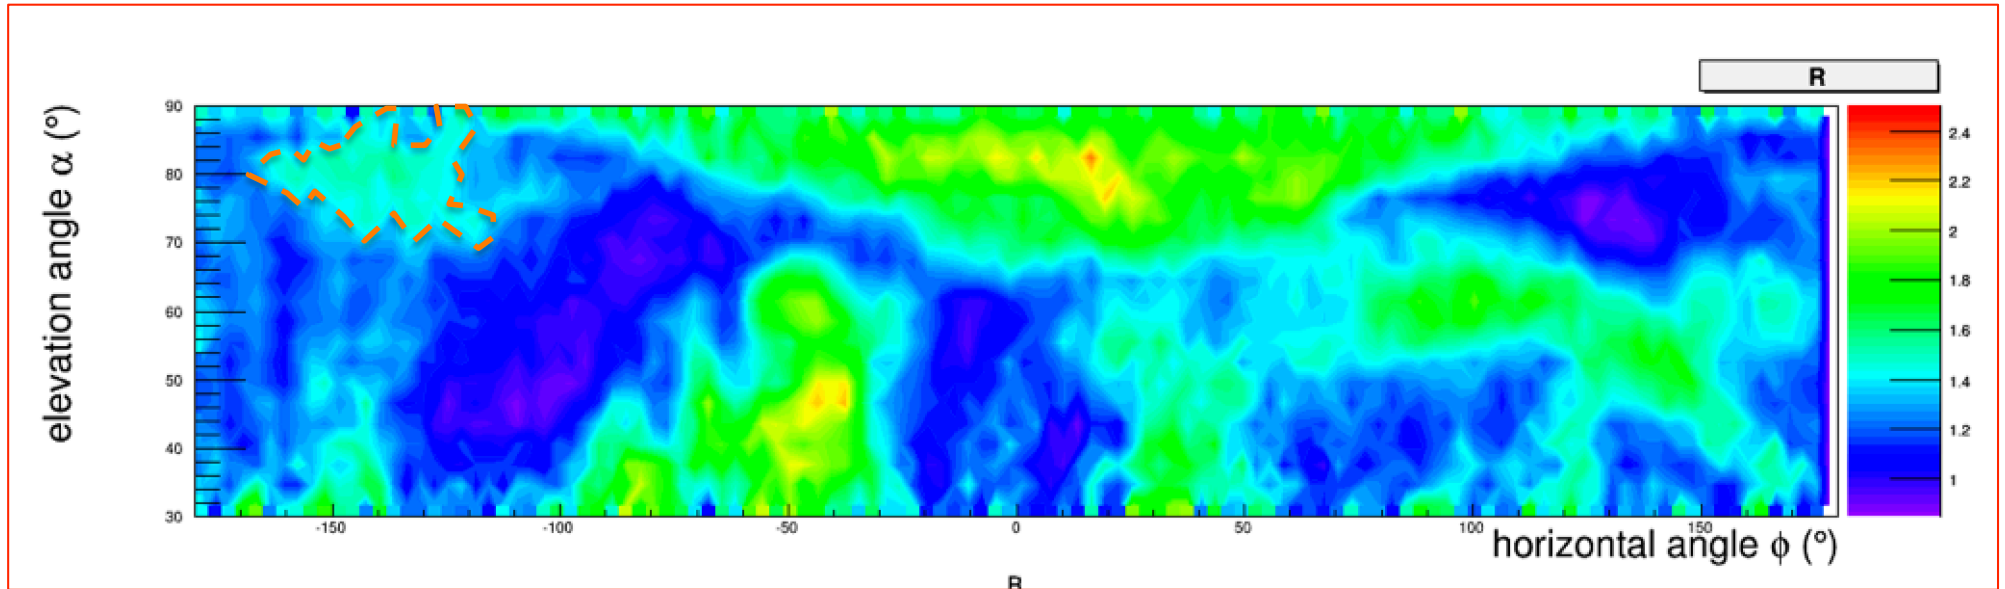

The points define the angular region of the room above the detector.

Intersections of lines starting from the detector and with the points define the directions with the plane of the ceiling of the chambers were evaluated.

Clear correspondence

Comparison with structures

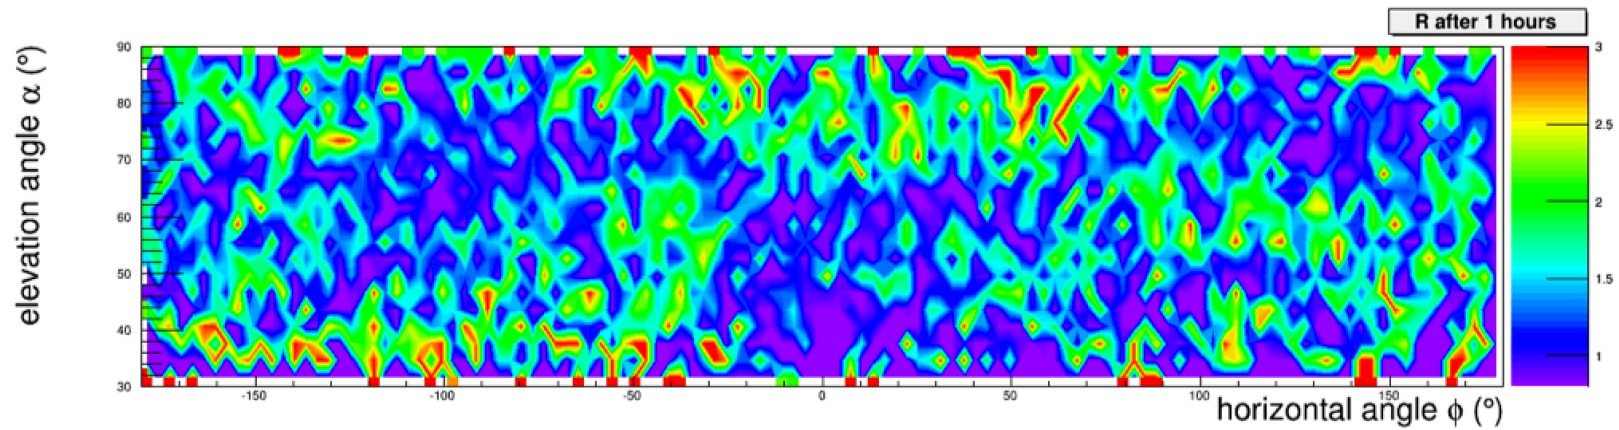

Most of the green area correspond to known structures

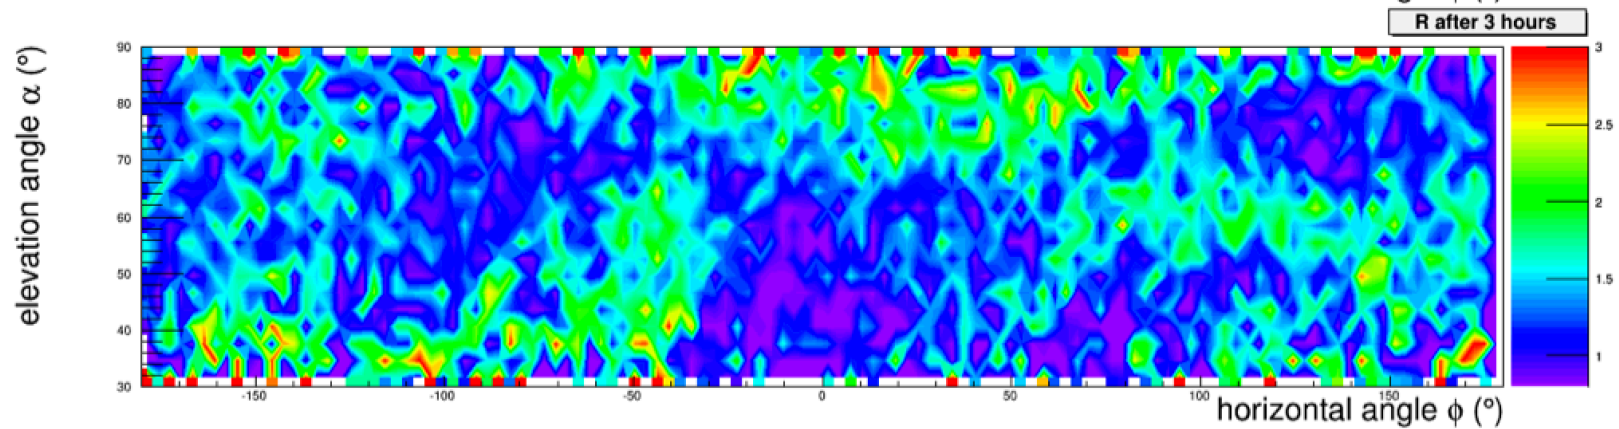

Hints of an unknown chamber (dashed line)

Time resolution

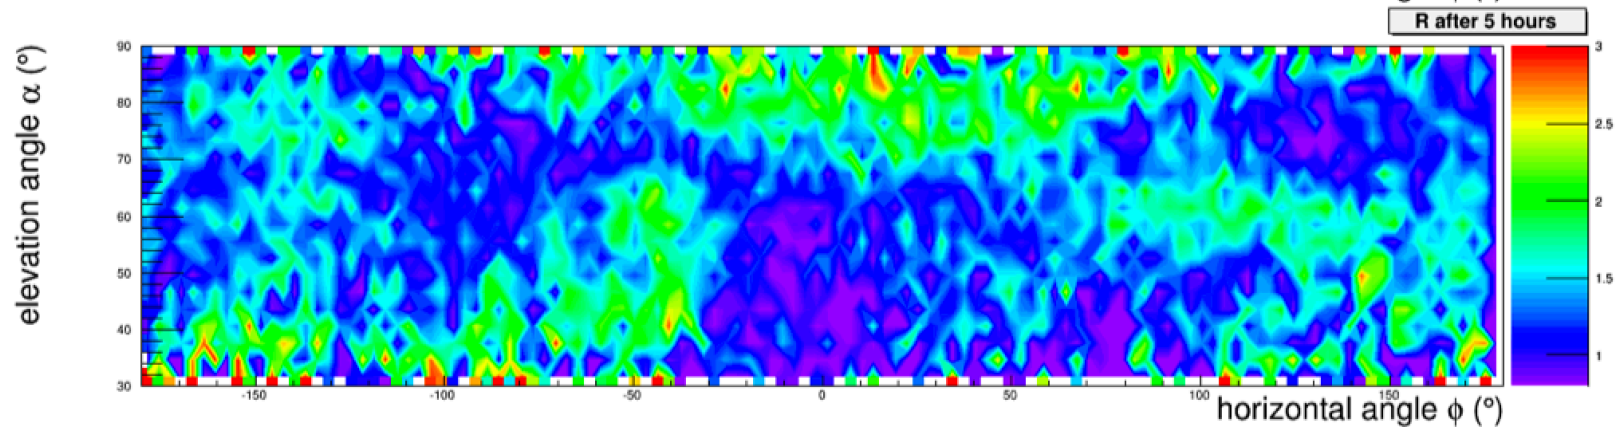

1 h

3 h

5 h

Conclusions

- We started a research program about muography applications in geological survey of cavities.
- A sample of 14×10^6 trigger was acquired under Mt. Echia
- Evidence of known structures
- Hints of a hidden chamber
- A second muon sample was acquired in a different position: analysis in progress
- A cylindrical detector for bore-hole is under construction
