

Ocean-based Muography

Hiroyuki Tanaka

Detection of the seafloor deformation (a few mm/yr)

Currently the ocean bottom pressure gauge (OBPG) is a unique solution

The OBPG has been applied to

A. monitoring a submarine volcano

Chadwick Jr., W.W. *et al. J. Volcanol. Geoth. Res.* (2006).

B. detecting a seismic vertical displacement of the seafloor and

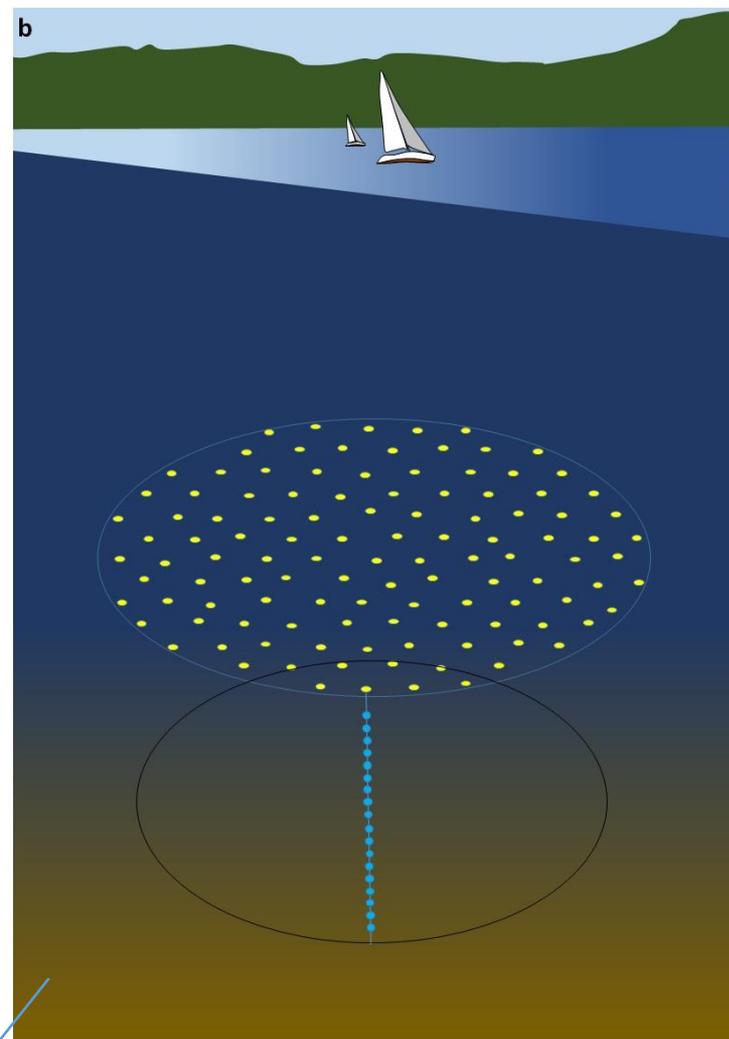

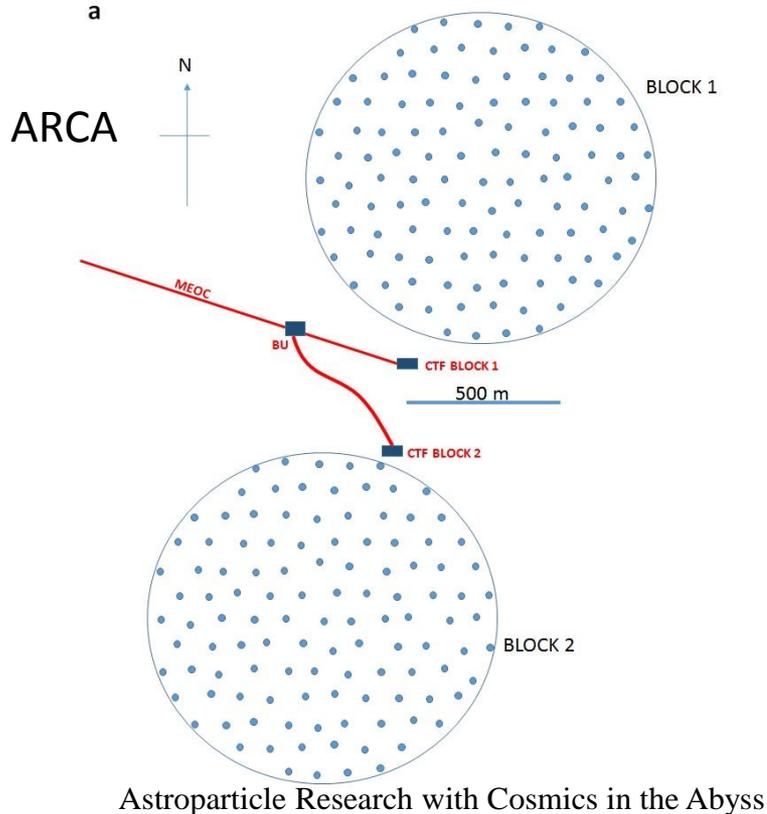

Ito, Y. *et al. Geophys. Res. Lett.* (2011)

C. tsunami wave propagation

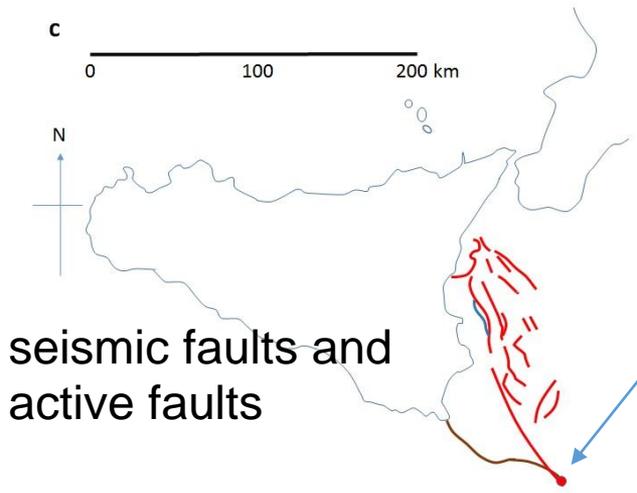

Maeda, T. *et al. Earth Planets Space* (2011)

Uplift and subsidence of the seafloor with an accuracy of up to a few mm (however) over a short time period (seconds to days)

Chadwick Jr., W.W. *et al. J. Volcanol. Geoth. Res.* (2006).

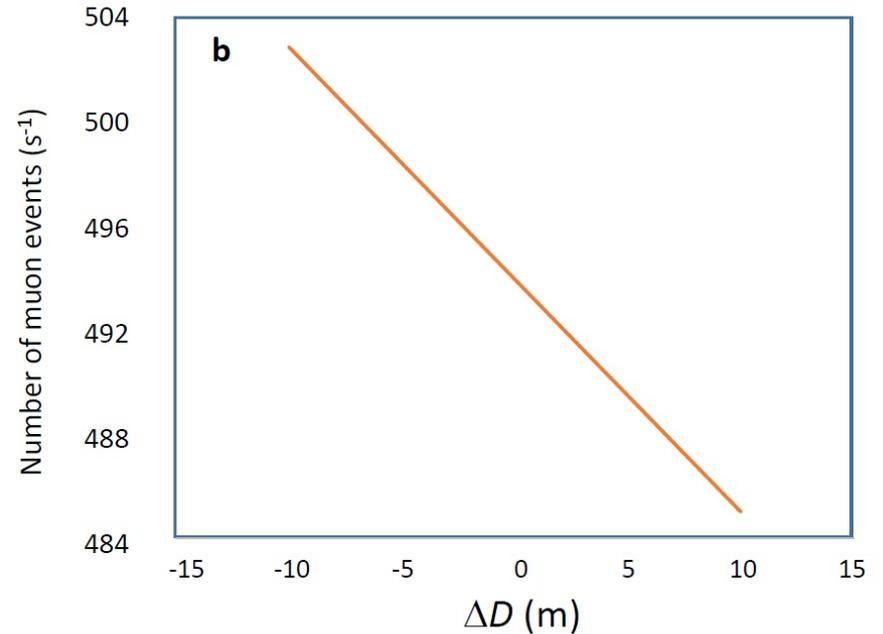

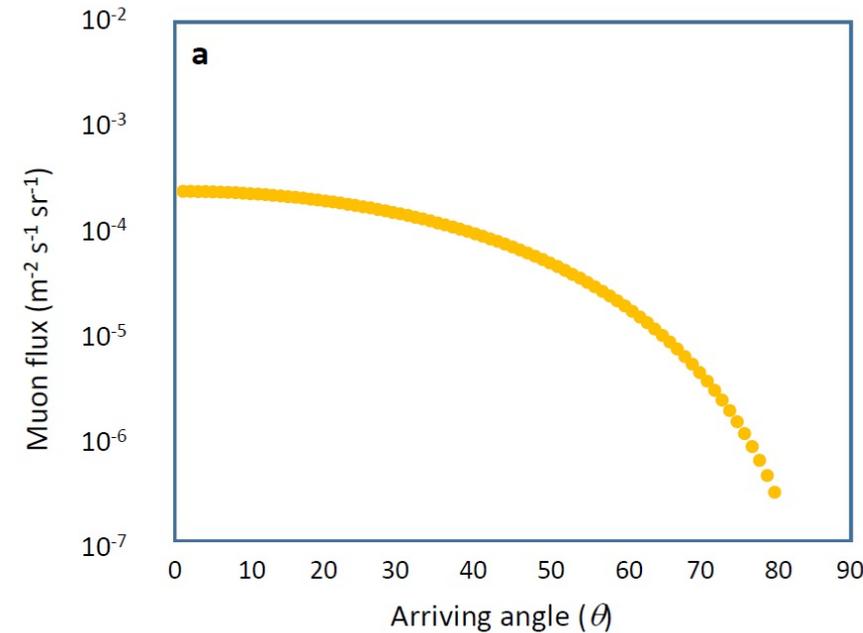

2888-3500 m below sea level

Uplift rates in southern Calabria and eastern Sicily were significantly high at a rate of more than 2 mm/yr between late Pleistocene and Holocene Antoniolli, F. *et al. Tectonophysics* (2006)

Muon event rate at ARCA

seawater density: 1.02 gcm^{-3}

$I = 366.73 E^{-1.976}$ L3 *Phys. Lett. B* (2004)

CSDA range Groom et al. 2012

present modeling, CORSIKA, MUPAGE, and ANTARES

$0.71, 0.72, 0.81, \text{ and } 0.90 \times 10^{-3} \text{ s}^{-1} \text{ m}^{-2}$ @ 2350 m bsl

Reduction factor of $1.6 \pm 0.1, 1.7, 1.7, \text{ and } 1.7$ (2050 m to 2350 m)

Aguilar, J.A. *et al. Astropart. Phys.* (2010).
