

Muography: perspective drawing in the 21st century

Hideaki Miyamoto

Muography is an innovative method to obtain a perspective view of a massive body. Its application areas are now rapidly expanding into many fields including perspectives of nuclear reactors, blast furnaces, pyramids, and perhaps, even space explorations in the near future. In order to widely demonstrate the principles and importance of this new technology and its future applications to general public, we organized the science exhibition titled “Muography: perspective drawing in the 21st century” at the Intermediatheque (IMT), located in the Kitte Marunouchi building right beside Tokyo station. In this talk, I will present the outline of the exhibit and what we learned from the exhibit.
